

Soft-Close, Self-Close, and Push-Open Functions

Self-close drawer slides are the standard option from many builders as it is the most economical option. The drawer pulls itself closed in the final two inches of closing. Since there are no dampers like there are on a soft-close drawer slide, the cabinet door could slam if it is closed too hard.

Soft-close drawer slides have become a must-have for most homeowners. The drawer pulls itself closed in the final two inches of closing. Since there are dampers, the drawer closes softly. The desire for this type of function is most often based on the decrease in noise when closing. However, homeowners will also find that the dampers will keep the contents of the drawers from shifting.

Push-open drawer slides are a great option for a handle-less kitchen, giving the clean European look. Since opening only requires a simple push, those who suffer from arthritis may find push-open slides appealing for the lack of having to grip a handle. This feature is often used for hidden drawers.

Builder options will vary. Ask us for details!
